

Carl,

I've been going over the analytical costs in more detail and, for now, I am making the following assumptions for the fish tissue study:

Dioxin, PCBs, and DDTs will be analyzed from composite (depth not station) samples for the water (and sediment cores?).

Metals will be analyzed for individual grab samples for each depth at each station (no composites).

These all based on the schedules I included in the proposed permit I sent yesterday.

All this would be worked out in detail in the study plan process later, but I'd like to give the canneries a good cost estimate.

Give me a call with your thoughts.

Steve
